⭐ Task: Create a Simple Profile Card

Requirements:

1 . ProfileCard Component:

- Create a functional component named `ProfileCard`.
- This component should accept props for `name`, `age`, `occupation`, and `profileImage`.

2 . App Component:

- In your main `App` component, use the `ProfileCard` component.
- Pass appropriate values for the props (e.g., name, age, occupation, profileImage).
- Try to create a profileCard at list for three different profiles.

3 . Styling:

- Add some basic CSS to style the profile card. Ensure it looks neat and organized.
- The card should display the profile image, name, age, and occupation in a visually appealing manner as example you can see the demo picture attached below.

😛 Tips:

- Ensure you understand how props are passed and used in components.
- Focus on getting the basic functionality working before adding optional enhancements.

Design

Name: hile
Age: 35
occupation:MERN developer

Name: chaltu
Age: 42
occupation:devOps

Name: hagose
Age: 37
occupation:QA/Tester
